Kitchen Cabinet Hardware Checklist

- ❑ Decide knobs vs pulls: knobs on doors, pulls on drawers and heavy doors.
- ❑ Pick one pull design and one knob design, in the same finish, for the whole kitchen.
- ❑ Size pulls to about one-third of the drawer width (8 in. pull for a 24 in. drawer).
- ❑ Use knobs 1 to 1.5 in. on standard doors; pulls 5 to 6 in. center to center.
- ❑ Choose longer, sturdier appliance pulls (12 to 18 in.) for integrated appliance panels.
- ❑ Pick a finish that holds up: brushed nickel or chrome for durability, satin brass for warmth.
- ❑ Match the hardware finish to the faucet finish, or stay in the same metal family.
- ❑ Match hardware to cabinet style: simple pulls for shaker, detailed pulls for traditional, slim bar pulls for flat-panel.
- ❑ Place door knobs 2 to 3 in. from the corner on the opening side; center drawer pulls.
- ❑ Test placement with painter's tape on one door before drilling the rest.
- ❑ Count every door and drawer, then order a few spare pieces in the same finish.
- ❑ Check clearance so neighboring pulls do not strike each other when doors swing open.
